## Design \& Selection

## 1. Working environment

## A CAUTION

IP65 (IEC60529 (IEC529: 1989-11)) standards are applied to the test. Avoid use in condition which water or coolant could directly contact the valve.
Explanation of protection property symbols and examination method of IP65

- Protective structure

Note: IP-65 is a standard as followings.
EC (International Electrotechnical Commission) standards (IEC60529 (IEC529: 1989-11))

## 2. Alternating current voltage specifications

## CAUTION

■AC voltage specifications are built into all wave rectification circuits.
When using SSR to turn the solenoid valve ON and OFF, solenoid valve recovery could fail. Take care when selecting the SSR. (Consult with the relay or PLC manufacturer.)

## 3. Surge suppressor

## CAUTION

- "The surge suppressor enclosed with the solenoid valve is to protect the output contact for that solenoid valve's drive. There is no significant protection for other devices in the area, and the surge may cause damage or malfunctions. Surge generated by other devices could be absorbed and cause damage such as burning. Care must be taken for points below."
The surge suppressor limits solenoid valve surge voltage, which can reach several hundred volts, to a lower voltage level withstandable by the output contact. Depending on the output circuit used, this may be insufficient and could result in damage or malfunction. Check whether the surge suppressor can be used by the surge voltage limit of the solenoid valve in use, the output device's withstand pressure and circuit structure, and by the degree of return delay time. If necessary, provide other surge measures. Solenoid valves with surge suppressors suppress the reverse voltage surge generated during OFF operation to the levels below.

| Rated voltage | Reverse voltage value when OFF |
| :---: | :---: |
| 12 VDC | 27 V |
| 24 VDC | 47 V |

When using the NPN output unit, a surge voltage equivalent to the voltage above plus the power voltage surge could be applied. Provide contact protection circuit.
(Output transistor protection circuit parallel setting example 1)

Programmable controller side

## Design \& Selection

#### Abstract

MN3EO MN4EO

If another device or solenoid valve is connected in parallel to the solenoid valve, reverse voltage surge generated when the solenoid valve is off is applied to these devices. Even when using the solenoid valve with a 24 VDC surge suppressor, the surge voltage could reach several tens of volts depending on the model. This revere polarity voltage could damage devices connected in parallel or cause them to malfunction. Avoid parallel connection of devices suspected of reversing polarity voltages, e.g., LED indicators. When driving several solenoid valves in parallel, the surge from other solenoid valves could enter the surge suppressor of one solenoid valve with a surge suppressor. Depending on the current value, that surge suppressor could burn. When driving several solenoid valves with surge suppressors in parallel, surge current could concentrate at the surge suppressor with the lowest limit voltage and cause similar burning. Even if the solenoid valve type is the same, the surge suppressor's limit voltage can be inconsistent, and in the worst case, could result in burning. Avoid driving several solenoid valves in parallel.

The surge suppressor incorporated in the solenoid valve often short-circuits if damaged by overvoltage or overcurrent from a source other than the solenoid valve. If the surge suppressor fails, if a large current flows when output is on, the output circuit or solenoid valve could be damaged or ignite. Do not keep power on in a faulty state. Provide an overcurrent protection circuit on the power or drive circuit or use a power supply with overcurrent protection so that a large current does not flow continuously.

## 4. Partition plug

When using partition plug, consult with CKD sales office.

## Installation \& Adjustment

## 1. Common

## A CAUTION

Port indication
Port positions such as 1P and 4A, etc., are indicated in accordance with ISO and JIS standards.

| Applications | ISO standards | JIS standards |
| :---: | :---: | :---: |
| Supply port | 1 | P |
| Output port | 4 | A |
| Output port | 2 | B |
| Exhaust port | 5 | R1 |
| Exhaust port | 3 | R2 |
| Pilot air supplying port | $12 / 14$ | PA |
| Pilot exhaust port | $82 / 84$ | PR |

Any valve mounting attitude is permissible. Check the port symbol to pipe as a reverse action such as cylinder, etc., is not created.

## 2. Port filter

## A CAUTION

Port filter is used to prevent foreign materials from entering, and problems in a valve. This is not for improving quality of compressed air, so read the warning and the cautions in the Introduction very well, then implement installation and adjustment.
Do not remove or force the port filter.
The filter could deform and result in problems. If contaminants and foreign materials are found on the filter surface, flash lightly, or remove them by tweezers, etc.

Example of integrating $A / B$ port filter

For cartridge joint

## During Use \& Maintenance

## 1. Valve replacement

## CAUTION

Check that the gasket does not fall off when replacing and installing the valve.

| Mounting bolt | Thread size | Hexagonal wrench <br> size | Proper tightening <br> torque (N.m) |
| :---: | :---: | :---: | :---: |
| Hexagon socket head bolt | M4 | Nominal 3 | 2.4 to 2.6 |

## 2. Pilot air OFF function (M7)

## A CAUTION

■ The supply of pilot air is forcibly stopped when power is on, so the main valve can be switched even when power is on.
When using the OFF function, caution is required because the cylinder moves immediately when using the 2-position single and 3 -position $\mathrm{A} / \mathrm{B} / \mathrm{R}$ connection or $\mathrm{P} / \mathrm{A} / \mathrm{B}$ connection.

## Output port destination list

How to operate M7 switch
(1) When using OFF function

Slide the M7 switch in the direction of the arrow until it stops.
This is a lock switch, so the OFF function is not reset even if the switch is released.

(2) During normal use

Return the M7 switch to the original position.

## WARNING

When conducting manual operations, make sure that there are no people near the moving cylinder.

## 3. How to replace cartridge joint

## CAUTION

Check procedures before changing the push-in joint size. Problems such as air leakage could occur if the joint is not installed properly or if mounting threads are not tightened sufficiently.

(1) Remove the set screw.
(2) Pull out the joint stopper plate and joint together.
(3) Align the stopper plate with the groove on the replacement joint, and assemble temporarily.
(4) Assemble the stopper plate and joint together, and tighten the set screw. Pull on the joint to confirm that it is properly installed. (Tightening torque: 0.55 to $0.65 \mathrm{~N} \cdot \mathrm{~m}$ )

Cartridge type push-in joint model no.

| Model | Part name | Model no. |
| :--- | :--- | :--- |
| W4G4 | $ø 8$ straight | 4G4-JOINT-C8 |
|  | $ø 10$ straight | 4G4-JOINT-C10 |
|  | $\varnothing 12$ straight | 4G4-JOINT-C12 |

## Note on selection guide

Fill out "manifold specifications".
Note 1: W4GB4*9: Plug-in connector
NW4G*4*0: Electric wire for relay (AC)
Connector for relay (DC)
Note 2: Standard wiring $\cdots$ Wired based on the installed valve.
Double wiring … Double-solenoid wiring used regardless of installed valve.
Note 3: Select either "M" or "M7".
Note 4: Both lock devices with non-locking manual override and pilot air OFF function are provided.
Note 5 : Instruct spacer installation position and quantity with the manifold specifications.
Refer to page 559 for the details.
Note 6: This is common for internal and external pilot.
Note 7: For slave unit (OPP2), standard specifications are different from coolant proof specifications.

| Option | Slave unit cover material | Specifications |
| :---: | :--- | :--- |
| Standard | Polycarbonate | Spatter proof |
| A | Nylon | Coolant proof |

Note 8: A filter to prevent entry of foreign matter is incorporated in end block $1(\mathrm{P})$ port as standard.
Note 9: The maximum number of MF stations is 16 with standard wiring and 8 with double wiring.
Note 10: 100/110 VAC and 12 VDC settings are not used for serial transmission connection specifications.

## NW4G

## Block manifold: Block configurations

Simple, unrestricted assembly makes it easy to increase stations and conduct maintenance.
Valve block with solenoid valve
(1) Arrange required solenoid valves for required stations.

Note that the maximum number of stations is determined by wiring. (Refer to pages 538,542 .) (2) Solenoid valve numbers are counted as stations 1st, 2nd, or 3rd etc. from left side.
(1) End blocks are installed on both ends of the manifold.

Manifold base
(1) Orders for only the manifold base are also accepted, but the specifications may be limited.
(The manifold specifications are not needed when only the manifold base is ordered.)

## W4G4

## Technical data (1) Pneumatics system selection guide

(1) The cylinder's average speed is based on the W4G4 Series and piping combination. It is expressed by the cylinder's piston speed obtained by dividing the stroke by the time the piston rod moved after starting, when the cylinder rod is installed facing upward. When the load rate is $50 \%$, the average speed should be the approximate cylinder speed multiplied by 0.5 .
(2) The average cylinder speed indicated in the pneumatic device selection catalog is the value when one cylinder is operated discretely.
(3) The effective sectional area of the solenoid valve used for the calculation below is the 2-position value.
(4) This selection guide is just reference. With the CKD sizing program, confirm conditions to be actually used.

## Standard system table

| Valve | System No. | Flow control valve | Silencer | Piping | Composite efiective sececional area (mmi) <br> Pipe length 1 m |
| :---: | :---: | :---: | :---: | :---: | :---: |
| W4GB410 | C2 | SC1-8 | SLW-8A | $\varnothing 10 \times \varnothing 7.2$ | 9.7 |
|  | C 3 | SC1-10 | SLW-10A | $\varnothing 15 \times \varnothing 11.5$ | 15.6 |

Technical data (1) Pneumatics system selection guide

## How to use guide

MN3EO
MN4EO
The device selection guide is used to select the optimum model.
Selection of components to be driven
Wheth $\square$
Select the cylinder's theoretical reference speed using the table below as a reference.

| Degree of cylinder speed | Theoretical reference speed $(\mathrm{mm} / \mathrm{s})$ |
| :---: | :---: |
| Low speed | 250 |
| Medium speed | 500 |
| High speed | 750 |
| Ultra high speed | 1,000 |

Select the standard system No. appropriate fo $\square$

## Explanation of technical terms

Theoretical
the same as the no-load value.When load is applied, speed drops considerably.)
$v o=1920 \times \frac{\mathrm{S}}{\mathrm{A}} 2445 \times \frac{\mathrm{S}}{\mathrm{D}^{2}} \longrightarrow$ (1)
$v$ o: Theoretical reference speed ( $\mathrm{mm} / \mathrm{s}$ )
A: Cylinder cross-section areas ( $\mathrm{cm}^{2}$ )
S : Composite effective sectional area of circuit $\left(\mathrm{mm}^{2}\right)$
D : Cylinder bore size (cm)
Whe

$$
v o=\frac{l}{\mathrm{t} 3}(\mathrm{~A} / \mathrm{s})
$$

t 1 : Time until movement starts
t2 : Time of primary delay
t3 : Time during constant movement
$\ell:$ Stroke length
Note: t1, t2 varies depending on the load.
It can be neglected when there is no load

Required flow rate: Momentary flow rate passed when the cylinder operates at vo speed. This is expressed with the equation below.
In the table, this is the value when $P=0.5 \mathrm{MPa}$. The required flow rate is that required for selecting the clean air system.

$$
\begin{align*}
\mathrm{Q}= & \frac{\mathrm{A} v o(\mathrm{P}+0.101) \times 60}{0.101 \times 10^{4}}=\left\{\frac{\mathrm{A} v o(\mathrm{P}+1.03) \times 60}{1.03 \times 10^{4}}\right\}  \tag{2}\\
& \mathrm{Q}: \text { Required flow (RX) (ANR) } \\
& \mathrm{P}: \text { Supply pressure (MPa) }
\end{align*}
$$

Required effective sectional area: Composite effective sectional area for the exhaust circuit required for moving the cylinder at vo speed. (Composite effective sectional area of valve, speed controller, silencer and piping.)

- Appropriate standard system: A combination of the optimum valve, speed controller, silencer, and pipe diameter required to operate the cylinder at vo speed. The combination in the table is for a piping length of 1 m .

## How to calculate flow

Shown as followings depending on the practical unit
Chalk flow when $\frac{P_{2}+0.1}{P_{1}+0.1} \leqq b$
$Q=600 \times C\left(P_{1}+0.1\right) \sqrt{\frac{293}{273+t}}$

Subsonic flow when $\frac{P_{2}+0.1}{P_{1}+0.1}>b$
Q : Air flow rate $\left[\mathrm{dm}^{3} / \mathrm{min}(\mathrm{ANR})\right]$, SI unit $\mathrm{dm}^{3}$ (cubic decimeter) is expressed with $\ell$ (liter). $1 \mathrm{dm}^{3}=1 \ell$
C : The sonic conductance ( $\mathrm{dm}^{3} /(\mathrm{s}$ :bar))
b : Critical pressure percent (-)
$\mathrm{P}_{1}$ : Primary side pressure (MPa)
$\mathrm{P}_{2}$ : Secondary side pressure (MPa)
t : Temperature $\left({ }^{\circ} \mathrm{C}\right)$
$Q=600 \times C\left(P_{1}+0.1\right) \sqrt{1-\left[\frac{\frac{P_{2}+0.1}{P_{1}+0.1}-b}{1-b}\right]^{2}} \sqrt{\frac{293}{273+t}}$

Technical data (2) Notes when wiring: Serial transmission type

MN3EO MN4EO

## Notes when wiring

[Notes for serial transmission type (T6*)]
(1) The slave station output number differs with the manufacturer, but connector pin numbers in the manifold and manifold solenoids correspond as shown below.
4GA/B (2) Internal connectors are wired in order, so depending on the number of manifold stations there may be open output numbers. These open outputs are used only for purposes other than driving the solenoid valve manifold being used.
(4) Use the slave station for each communication system.

Refer to technical data on page 569 for the specifications on the usable PLC models, host unit models and communication systems.
(5) Manifold station numbers are set in order from the left facing the piping port regardless of the wiring block position.

MN3SO (6) Contact the PLC manufacturer for information on the PLC.

## W4G4 <br> Series

Technical data (2) Notes when wiring: Wiring between blocks

## Wiring between wiring block and valve block (DC specifications)

A part called a dedicated wiring connector is incorporated in the valve block and supply and exhaust port, etc. With this structure, the wiring is completed when the block manifold is disassembled or assembled. No special wiring is required during disassembly or assembly. There is a regularity between wiring block connector pin numbers and wired valves, so check wiring for each wiring block, and connect between the valve and control unit. Pay special attention when expanding or reducing the number of valve blocks. An example of the wiring circuit for expansion is shown below.

## Wiring example of circuit

4GA/B
(Master) The figure below is an example for the MW4G4 wiring circuit, and differs from actual specifications.

## Double wiring

If one valve block is added between the second and third stations, the outputs assigned to No. 5 and No. 6 on the wiring block's common gland are automatically shifted to common gland No. 7 and No. 8, two solenoid places away.

## Standard wiring

The same as for double wiring, the common gland number is shifted and assigned. Shifting differs with the solenoid valve. When using one solenoid (2-position single), the common gland number shifts by one solenoid space. When using two solenoids (2-position double, 3-position), numbers are shifted by two solenoid spaces.

Technical data (3) How to expand reduced wiring manifold

## Deal drawing of block manifold

Example of disassembling: For MW4GB4 common gland left wiring specifications

## Valve block expansion

(1) Remove tie rod set screw.
(2) Remove the blocks to the position to be expanded.
(3) Mount the tie-rod for expansion.
(4) Install valve blocks to be added.
(5) Eliminate clearance between blocks, and couple with a hexagon socket head bolt. (Tightening torque: 7.0 to $8.0 \mathrm{~N} \cdot \mathrm{~m}$ )

Replace of valve
How to remove
(1) Loosen the two set screws.
(2) Remove the valve from the valve block.

How to install
Install the valve following removal procedures in reverse.
Refer to the table below for the set screw's recommended tightening torque.

Recommended tightening torque of valve set screw

|  | size | Recommended tightening torque (N.m) |
| :---: | :---: | :---: |
| W4G4 | M4 | 2.4 to 2.6 |

Technical data (3) How to expand reduced wiring manifold

*1: Wiring is required only when expanding AC specifications.
*2: Use the valve block with masking plate as a reserved block if specifications will be changed for AC specifications.

Connection procedure of T10 electric circuit board (double wiring)
When using double wiring specifications, double solenoid wiring is used regardless of the installed solenoid valve's switching position class. The same wiring is used only for standard wiring and double wiring double SOL.
2) For double SOL
(MF station number; up to 8 stations)

MN3SO MN4SO

[^0]:    Note 1: Effective sectional area S and sonic conductance C are converted as $\mathrm{S} \fallingdotseq 5.0 \times \mathrm{C}$
    Note 2: Flow characteristics are values for port size Rc3/8.

[^1]:    Note) Max. flow rate: for FRL, FR and R, primary pressure= 0.7
