## DATA SHEET

## C2-20

Advanced Actuator Controller

## concense

- excellent electric actuators

The C2-20 actuator controller provides advanced positioning and control of actuators through easy and flexible integration with the application. The controller is designed to work with Concens electrical in-line actuators in applications where positioning is required. C2-20 has adjustable acceleration and deceleration ramps, which make smooth starts and stops possible

Adjustable current limits in both directions protect the motor against overcurrent. In learning mode the number of hall pulses in a full stroke of the actuator is counted which enables accurate positioning during normal operation.

The position of the actuator is controlled by a DC voltage between 0-5 or 0-10 Volts to the C2-20. Adjustments and parameter settings like current limit value, ramp times, speed etc. are set with C2-PROG interface unit or C2-USB "dongle" connected to a PC.

## Features

- Precise position control from analog voltage input
- Soft start and soft stop
- Settable current limit
- High efficiency
- High momentary load capacity
- DIN-rail base fittable

■ "Position reached" - signal

## Technical Data

Supply voltage $10-35 \mathrm{VDC}$
Ripple Less than 20\%
Actuator current
continuous max $15 \mathrm{~A}\left(\mathrm{Ta}<60^{\circ} \mathrm{C}\right)$
Actuator current max 20A (short time)
Current limit adj. 0.1-20A
Overheat limit $100^{\circ} \mathrm{C}$
PWM frequency 2 kHz
Hall input freq. Max 1 kHz
Input control logic High=4-30V,
(pos.) Low $=0-1 \mathrm{~V}$ or open
Control input
impedances typ.
Motor and supply
connectors
Control connectors
Dimensions $73 \times 43 \times 25 \mathrm{~mm}(\mathrm{~L} \times W \times H)$
Weight 75g
Operating temp ( Ta ) -20 to $+70^{\circ} \mathrm{C}$
Idle current 45 mA

FIG. 1 WIRING FOR C2-20

FIG. 2 CIRCUIT DIAGRAM

## WIRING AND SETTINGS

First run the learning cycle and then do the settings with serial interface unit "C2-PROG" or PC. Default values in ( )

1/15 Speed: $35-100 \%<35-100$ ( 100 )
2/15 Learning speed: $35-100 \%<=>35-100$ (50)
3/15 I-limit "forward": 0,1-20,0A $\Leftrightarrow 1-200$ (20)
4/15 I-limit "reverse": 0,1-20,0A $\Leftrightarrow 1-200$ (20)
Notice! Current limits are 1.5 times higher during
start ramp and 1 sec . thereafter
5/15 I-trip enable: $0 / 1 \Leftrightarrow$ off/on ( 1 )
6/15 I-trip delay: $0-255 \mathrm{~ms} \Leftrightarrow 0-255$ (5)
7/15 Load compensation: $0-255 \Leftrightarrow 0-255$ ( 0 )
8/15 Pulse lost timeout: $1-5 s<\Rightarrow 1-5$ (2)
9/15 Start value: 0-50\% < $=>0-50$ (30)
10/15 Hour/Start count reset: 0-1, reset when set to 1
11/15 Brake area: $0,0-20,0 \% \Leftrightarrow 0-200(50)$
12/15 Dead zone: 0,0-10,0\% $<=>0-100$ (10)
13/15 Range scale in: $+0,0-50,0 \% \ll 0-500(7)$
14/15 Range scale out: - $0,0-50,0 \%<=>0-500$ (70)
15/15 Start ramp: $0,1-5 s \ll 0-500$ (100)

## FIG. 3 POSITIONING WINDOW

## FIG. 5 RANGE SCALING

■ Speed limits the maximum speed

- Learning speed sets the learning cycle speed. (FIG. 4)
- I-limits are individual for reverse and forward directions.
- I-trip enables the trip function, so that motor will be shut down when the set I-limit is exceeded. Motor has to be started in opposite direction after trip.
- I-trip delay defines the reaction time for trip.
- Load compensation increases the torque at low speed. Note that over-compensation will cause oscillation and twiching of the motor.
- Pulse lost timeout stops motor after the set time without pulses.
- Start value is a voltage level for start (\% of full), this ensures that the motor gets an adequate voltage to start properly, but note that too high start level will cause motor vibration (FIG. 3).
- Brake area (soft-stop) is proportional value of the full stroke. In low speed application good value is near $1 \%$, and in high speed solution it can be near to 20\% (FIG. 3).
- Dead zone is steady area, suitable size of this zone depends on the mechanical accuracy of the system, this value is also a ratio of the full stroke (\%) (FIG. 3).
- Hour/Start count reset makes possible to set the hour/start counter to zero.
- Range scale adjustment is for scaling of the stroke, with this the scale can be adjusted after learning. The reverse and forward ends are individually scaleable to get the suitable mechanical stroke for set value from 0-10V (0-5V) (FIG. 5).
- Start ramp (soft-start) defines the time before reaching full speed.

## STATUS LED SIGNALS

1. Fast blinking $=$ Stopped due to current limiter active
2. Slow blinking = Overtemperature
3. Short, mid, long... = Hall pulse lost
4. $4 x$ fast blinking (burst), pause $=$ Overvoltage
5. $2 x$ short, $1 x$ long $=$ Fault in
6. LED permanent on $=$ Learning not completed, new learning required
7. Start learning by giving an impulse to learn input (10)
8. Motor starts to run "out" direction with learn speed
9. Current limit stops the motor when mechanical end is reached
10. Motor starts to "in" direction and makes a full stroke. During stroke the pulse counter measures the range.
11. Motor reaches the mechanical end "in", and current limit stops the motor.
12. Device stores full range value and is ready for use
13. Original learned range $=$ mechanical full range equals the signal range $0-10 \mathrm{~V}(0-5 \mathrm{~V})$
14. Modified range example:

If range scale in $=+20 \%$ and
range scale out $=-20 \%$.
now stroke of actuator is compressed to: positioning set value $\mathrm{OV}=20 \%$ position positioning set value $10 \mathrm{~V}(5 \mathrm{~V})=80 \%$ position

C2-20-PCB-000-000000 (board alone)
$73 \times 43 \times 25 \mathrm{~mm}(\mathrm{~L} \times \mathrm{W} \times \mathrm{H})$

C2-20-BOX-000-000000 (box version)
$102 \times 73 \times 47 \mathrm{~mm}(\mathrm{~L} \times \mathrm{W} \times \mathrm{H})$

C2-20-DIN-000-000000 (DIN rail version)
$90 \times 46 \times 56 \mathrm{~mm}(\mathrm{~L} \times \mathrm{W} \times \mathrm{H})$

C2-USB Programming Cable for PC and C2-PROG Programming Unit

## Warnings and recommendations

- If C2-20 goes into "trip" (overcurrent) it is only possible to run actuator in opposite direction.
- Please adjust the max. current to be 10\% higher than maximum current during load. This ensures the longest actuator lifetime.
- Please ensure that the power supply for the controller is capable of supplying sufficient current - otherwise the controller and the actuator may be damaged.
- Doublecheck correct polarity of power supply. If connected wrong the C2-20 will be damaged.
- Attention! C2-20 has no fuse in it. Use external fuse according to application ( $2 \rightarrow 10 \mathrm{~A}$ slow).
- Concens does not have any responsibility over the possible errors in this data sheet.
- Specifications are to be changed without notice.
